Hydrobiologia
The International Journal on Limnology and Marine Sciences

Contents

Volume 349

Editorial Preface ..... vii–ix

The role of modelling in the control of toxic blue-green algae
by A.J.D. Ferguson 1–4

Modelling phytoplankton dynamics in lakes and reservoirs: the problem of in-situ growth rates
by C.S. Reynolds & A.E. Irish 5–17

Algal biomass and biogeochemistry in catchments and aquatic ecosystems: scaling of processes, models and empirical tests
by G.P. Harris 19–26

Scope and limitation in algal modelling – an example from the Thames Valley reservoirs
by J.A. Steel 27–37

Modelling algal growth and transport in rivers: a comparison of time series analysis, dynamic mass balance and neural network techniques
by P.G. Whitehead, A. Howard & C. Arulmani 39–46

ANNA – Artificial Neural Network model for predicting species abundance and succession of blue-green algae
by F. Recknagel 47–57

Statistical analysis of algal and water quality data
by P.E. Kneale & A. Howard 59–63

Modelling the daily integral of photosynthesis by phytoplankton: its dependence on the mean depth of the population
by A.E. Walsby 65–74

Sources of variability in the factors used for modelling primary productivity in eutrophic waters
by H. Schubert & R.M. Forster 75–85

Dynamical model of buoyant cyanobacteria
by A.P. Belov & J.D. Giles 87–97

Modelling vertical migration of the cyanobacterium *Microcystis*
by P.M. Visser, J. Passarge & L.R. Mur 99–109

Computer simulation modelling of buoyancy change in *Microcystis*
by A. Howard 111–117

Subject index 119–121

Author index 123

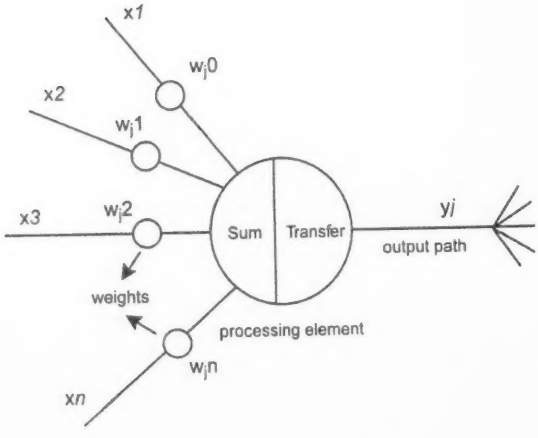

Illustration on cover: Function of a neural network-processing element. See pp. 39–46.
